Method and Apparatus for
Electronic Entertainment Device Access Control
And Interactive Response System

5

ABSTRACT OF THE DISCLOSURE

An access control system for an electronic entertainment device includes a processor and a memory comprising access control instructions for execution by the processor. The instructions periodically present a set of working queries during execution of an entertainment software application, accept answers to the working queries, and allow access to, or terminate, the entertainment software application based on the answers. Access is allowed for a supervisor configurable time period for each user and each entertainment software title.
